Summary

Senior software engineer with 5 years shipping full-stack products in production. Since 2026, platform engineer (IDP & AI): technical owner end to end, from architecture and delivery to engineering practice.

Skills

AI & LLMs: Claude Code, Codex, OpenCode, Antigravity, Claude Agent SDK & Anthropic API, Open-source models (Llama, DeepSeek, Qwen), Vercel AI SDK, LangGraph, MCP (servers & clients), tool calling, structured outputs, prompt engineering, prompt caching, RAG, embeddings, vector search, pgvector, hybrid search, reranking

Agentic Engineering: Agentic SDLC, spec-driven development, multi-agent orchestration, Agent Skills, hooks, context engineering, harness engineering, memory & context management, long-horizon agents, recursive self-improvement, reflection loops, human-in-the-loop, model routing, token budgeting

AI Evaluation & Security: Evals, LLM-as-judge, blind evaluation, golden sets, regression testing, guardrails, prompt-injection defense, sandboxing, agent permissions, AI governance, LLM observability, cost & token tracking

Platform & Infra: Platform Engineering, Internal Developer Platform (IDP), Backstage, golden paths, Kubernetes (EKS), Helm, CloudNativePG, PostgreSQL, Terraform / OpenTofu, Kong, GitOps, OCI / Quay, OpenTelemetry, Grafana, Tempo, Loki, Prometheus, FinOps

CI/CD & Release: GitHub Actions, GitLab CI, Docker, release engineering, Trivy, supply chain security, CVE remediation

Full-stack & Cloud: TypeScript / Node.js, Python, Go, NestJS, React, Next.js, React Router 7, Tailwind, React Native, PostgreSQL, MongoDB / Supabase, REST, OAuth 2.0, JWT, Playwright / Cypress / Vitest, AWS (EKS, Lambda, S3, StackSets), Multi-tenancy, Vercel, Cloudflare, Sentry

Experience

Platform Engineer — IDP & AI, Vertigo Tecnologia (VeeCode) Feb 2026 – present

Tech lead of VeeCode DevPortal, an open-source IDP built on Backstage, and of the company's AI front. From product to infrastructure, working directly with the CTO and CPO: architecture, releases and DevOps. I turn manual operations into self-service capabilities and bring AI agents into the product and the engineering process.

- **Agentic CI:** Created the agentic code-maintenance pipeline that fixed 200+ CVEs across the entire surface of the product and the Backstage templates. It decides what to fix and what to escalate, validates builds and tests, and delivers idempotent, auditable MRs.
- **DevPortal as an AI tool (MCP):** Exposed the platform catalog over MCP to AI assistants, in production: query and provisioning with per-user identity and auditable actions. With the catalog as context, agents diagnosed problems with +60% accuracy in a blind evaluation and zero destructive actions, identifying both cause and owner.
- **Agentic SDLC:** Created the company's standardized agentic development method and lead its rollout across engineering. It gives the team a single path from requirement to delivery, with autonomous agents on long-running work, verifiable quality and human approval on every merge, while respecting each project's own process.
- **Corporate AI & governance:** Lead the technical front and the governance of AI at the company: modeled the AI inventory with 300+ items in the portal, including the creation of the internal hub of skills and agents, giving the organization discovery and sharing across employees and, for managers and leadership, visibility and governance over AI use.

- **Multi-tenant platform & SaaS:** Turned cluster operations into a self-service product: from signup to a configured portal with no DevOps in the path. Isolated instances on Kubernetes, each with a dedicated database (CloudNativePG) and an automated lifecycle (provision, pause, destroy), about 15 running in parallel.
- **Self-service plugin marketplace:** Built the platform's self-service plugin marketplace, with 120+ extensions in production, giving teams the autonomy to extend the portal with ease. I run the 70+ plugin fleet with 100% deployment integrity and cut export time by 83%.
- **Golden path:** Led the platform's golden paths and the foundations behind them (observability, security, documentation, updates and rollout): instrumented, versioned templates ready for production in minutes. With the agentic rollout pipeline, I cut inherited vulnerabilities by over 90%; via MCP, the documentation becomes reliable context for agents: +70% debugging accuracy on platform-operated services.
- **Technical leadership:** Drove the product's evolution across three generations, from architecture to releases for enterprise customers, cutting the release cycle by 29%. In the product, established verification practices and standardized agent-driven development, with an engineering constitution strengthening the agentic SDLC. Total: 50+ architecture decisions, 40+ milestones with gates and 50+ critical vulnerabilities eliminated.
- **Infrastructure & enterprise operations:** Built the platform's infrastructure foundation: multi-account AWS catalog, FinOps and zero-data-loss observability, the production migration of ~400 components and the operation of enterprise customers in ERP, pharma and logistics.

Full-Stack Developer & AI Products, Hyperfy (Aivia Platforms Inc.) Nov 2024 – Jan 2026

White-label multi-tenant AI SaaS. End-to-end owner of multi-tenancy, payments and AI.

- **White-label multi-tenant platform:** Built the multi-tenant layer, serving 3,000+ tenants and 66+ custom domains in production, giving each customer the product under their own brand and domain.
- **Payments & monetization:** Built the platform's monetization on Stripe Billing and Connect: subscriptions and tiered revenue sharing, processing hundreds of events per day with payout integrity and auditing.
- **AI in production:** Brought generative AI into the product, with multi-provider streaming chat and tool calling and agent workflows with human-in-the-loop, in a global experience across 10 languages and multiple currencies.

Front-end Developer, GSS Impact Development Company Feb 2023 – Nov 2024

ESG and climate products for enterprise and public-sector clients, in Next.js/TypeScript.

- **Climate-action platform:** Delivered the core experience of the climate-action platform for small and micro businesses, from the emissions inventory to dashboards and carbon-offset purchases.
- **High-visibility clients:** Shipped production applications for the public sector and enterprise: Restaura Paraná (Government of Paraná) and Ipiranga Empresas' fleet emissions calculator.

Education

Universidade Cruzeiro do Sul, Bachelor's in Computer Science – Brazil Jan 2019 – Dec 2023

Rocketseat, Bootcamp in Programming – Brazil Aug 2021 – Aug 2022

Languages

English — B2 · Portuguese — Native

Certifications

Claude Certified Architect — Foundations (Anthropic), Jun 2026

Projects

cc-cockpit: Go dashboard that brings every coding-agent session on the machine into a single view.

Scribe: engine that turns work evidence into operational artifacts, agent-agnostic.

Vértice: deterministic credit-card recommender, explainable per category.

usagemeter: open-source Claude Code plugin for cost, tokens and limits across coding agents.
